

BNB HACK SUBMISSION

RiskGuard Adapter

Pre-execution policy verdicts for BNB Chain agents and ERC-8183-style jobs.

Open source

BSC testnet deployed

Two receipt transactions

Manifest-only ERC-8183 evidence payload

PROBLEM

Agents can propose financial actions faster than users can review.

- Blind trust in agent output is risky.
- Manual review does not scale.
- DeFi-specific policy evidence is often missing.
- Users need checks before signing or settlement.

SOLUTION

RiskGuard turns policy constraints into deterministic verdict receipts.

Checks

- Chain id
- Max value
- Allowed action
- Contract allowlist
- Token allowlist
- Max slippage

Outputs

- Allow verdict
- Block verdict
- Policy hash
- Proposal hash
- Evidence hash
- Manifest metadata

DEMO PROOF

Implemented and verifiable today.

- `riskguard validate`
- `riskguard demo`
- `riskguard foundry-env`
- `riskguard manifest`
- Solidity `PolicyReceiptRegistry`
- BSC testnet contract with receipt count **2**

ARCHITECTURE

Small component, clear place in the agent stack.

```
Agent intent / job
-> RiskGuard policy check
-> Policy Verdict Receipt
-> ERC-8183 manifest metadata
-> BSC testnet receipt proof
```

Manifest-only is implemented. Real ERC-8183 job submission and opBNB deployment are follow-up work.

WHY BNB

DeFAI and autonomous wallets need composable policy evidence.

- Reusable guardrail before autonomous DeFi actions.
- Deterministic evidence for allow/block decisions.
- BSC testnet proof already exists.
- Small integration surface for agents and wallets.

ROADMAP

Submission now, deeper integrations next.

- BscScan source verification if API key is available.
- Public demo video.
- Real ERC-8183 job submission if lightweight.
- Tiny receipt verifier.
- opBNB deployment.
- Policy templates for DeFAI and treasury workflows.
